

Setup

Each of these pieces has an inward face, on which its value is revealed, and an outward face, on which it appears identical to other pieces.

Each player has twelve pieces:

One black hexagonal pillar is used to represent the magnet.

The board has 91 vertices, on which the 24 pieces (12 red, 12 blue) may reside during the game. The center vertex is labeled with a white starburst. Setup vertices are marked with a red or blue glow.

Components

The object of the game is to control the center vertex with your King, or to capture your opponent's King.

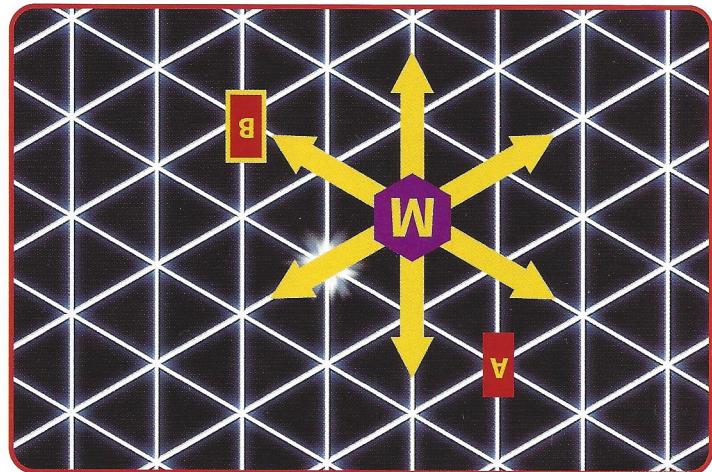

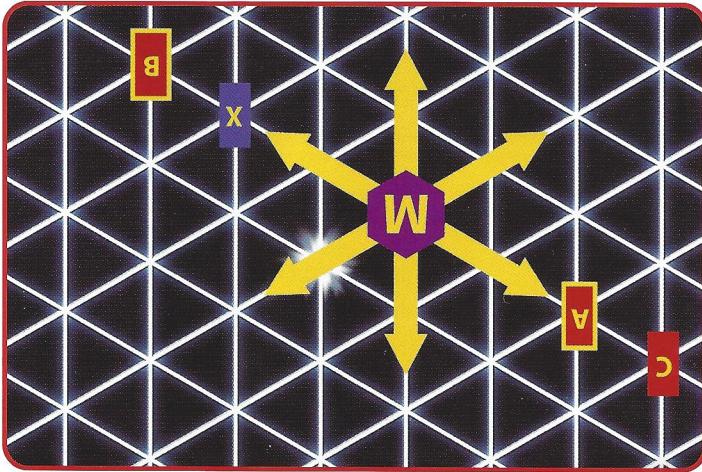

Object

MAGNET

Red's Move: Piece A is affected by the magnet (M). Piece B lies on a line radiating from the magnet's position (M), and is not affected by it. Piece C lies on the magnet's position (M), but is not blocked by piece A and is not affected. Piece X is an opposing piece and is not affected. Piece B is not affected because opposing pieces do not block the magnet.

Red's Move: Piece A does not lie on a line radiating from the magnet's position (M), and is not affected by it. Piece B lies on a line radiating from the magnet's position (M), and is affected by the magnet.

The magnet affects the closest friendly piece along each of the lines radiating from its location. A piece that occupies the same space as the magnet is not affected.

The magnet is placed in any vertex on the board, occupied or otherwise, so long as at least one piece is caused to move.

Placing the Magnet

When a turn is finished, if neither player has won the game, the magnet is removed from the board and given to the other player.

Turns alternate between the players, beginning with the red player. A turn involves placing the magnet, which affects the position of one or more of the player's own pieces.

Rank is the greatest number printed on the inward face (1-4). This is the highest rank a piece may attain. Once a piece's rank equals its value, it cannot be promoted further.

Rank is the number currently positioned at the top of the inner and outer faces (always the same number). Rank indicates the distance a piece can move in a single turn. Rank can increase during the game. All pieces begin with a rank of 1, but they may be promoted after movement. (The king's rank is always 1.)

Each piece (including the king and the traps) has a rank and a value.

Pieces: Rank and Value

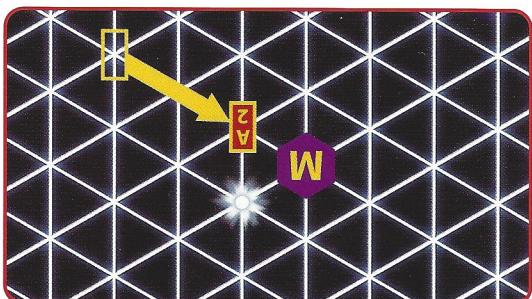

1 Change Position

A move is the following three activities, in order:

The affected piece moves toward the magnet a number of steps equal to its rank. If it enters the vertex with the magnet it stops there. It also stops moving if the next step

If it enters the vertex with the magnet, it stops there. It also stops moving if the next step would

The active player chooses the order in which affected pieces execute their moves. One piece must complete its move before the next piece begins. When all affected pieces have moved, the turn is over.

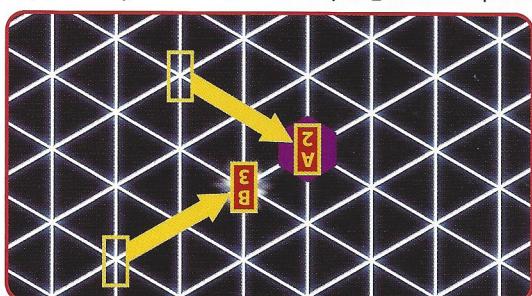

Moving Affected Pieces

Change Position

A move is the following three activities, in order:

The affected piece moves toward the magnet if it stops there. It also stops moving if the next step would

If it enters the vertex with the magnet, it stops there. It also stops moving if the next step would

Red's Move: Piece A (rank 2) is affected by the magnet (M) and will move two vertices towards the position of the magnet (M).

Red decides to move **A** first, moving it to the same vertex as the magnet (**M**). **A** goes to the same vertex as **M** (and **B** and **C** are unaffected).

Hed can then move B only two vertices even though it is rank 3, because it is blocked by piece A. Note that Red could have moved piece B before A, and then B would have blocked A instead.

Pieces never share a vertex. Where there is contact there is always a capture. A moving piece captures every opposing piece it encounters in the course of the move. It is possible for a single piece to capture multiple opposing pieces in the course of a single move. Captured pieces are removed from the game. Captured pieces in the course of a single move.

course of a single move.

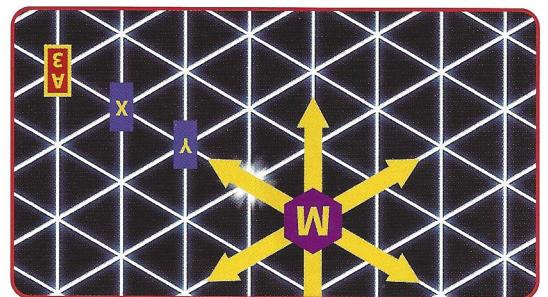

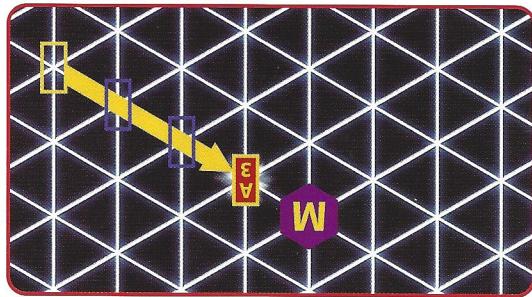

capturing a trap, the game ends immediately.

Reveal the value of the captured piece(s). If the King is captured, the game ends immediately.

capture

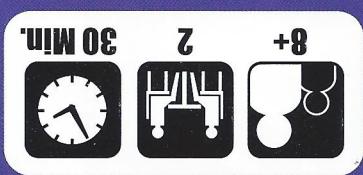

Red's Move: Piece A (rank 3) will capture both piece X and

Pieces X and Y are removed from the board. If neither piece was a trap, piece A would complete its move as shown above.

If the only pieces left in the game are the two kings, the first king to reach the center vertex wins immediately.

Two-King Victory

If exactly the same position is reached three times, the game ends in a draw.

Stalemate

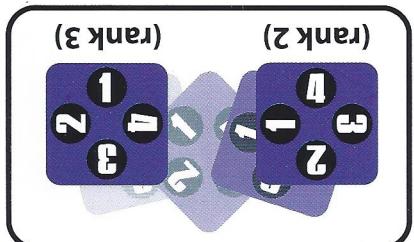

The game can also be won by controlling the center vertex with the king. At the beginning of a turn, but not at the end, a player may declare victory if his/her king is at the center vertex. (Thus it is not enough to move the king onto the center vertex, the king must also survive there during the opponent's turn.)

The game is won instantly whenever a king is captured. No further moves take place.

Winning the Game

Red takes the first turn, but may move only one piece, even if more than one piece is affected by the magnet. On Blue's reply, and all turns thereafter, there is no limit to the number of pieces that move.

Opening Move

Example promotion:

Rank can never be decreased, nor increased by more than one point per turn, nor increased beyond the value of the piece.

Pieces that change position can be promoted. Promoted pieces increase their rank by one. Change the rank by rotating the piece clockwise so the next higher number reads at the top of the inward face. (The same number will be indicated on the top of the outward face.)

Promote
